Intratone

ABOUT THE PROJECT

The Intratone app is a technical tool designed to interconnect a gate/door within the same ecosystem for residents. It is available on iOS and Android.

EXISTING VERSION

Here, we redesign the interface intended for private users. Since it is a restricted application, access requires compatible equipment, credentials provided by the property manager, and a previously configured Intratone intercom. The basic interface is not intended for the general public. This is why the current architecture is designed for utilitarian use, with dense technical vocabulary and an information hierarchy that is not optimized for an average user.

NEW VERSION

The redesign focuses on clarifying user flows, reducing friction in settings, and improving the visibility of key actions such as opening gates, managing badges, and consulting access. Interface colors were tested across multiple types of color vision deficiencies to validate hierarchies, interaction states, and contrast levels, ensuring the interface remains readable and usable for all users.

Wave Switch

ABOUT THE PROJECT

WaveSwitch is a touchless, gesture-activated switch imagined for a speculative future where physical interfaces gradually disappear from everyday environments. Instead of pressing a button, users interact with the system through simple hand movements detected by sensors and interpreted by artificial intelligence. The device translates gestures into actions, allowing users to control lighting or connected systems without physical contact.

INTERFACE AND INTERACTION

Beyond the object itself, the project is built around a digital interface that allows users to configure and understand the system. Through a mobile application and the integrated display on the switch, users can customize gestures, adjust sensitivity, test interactions, and receive real-time feedback. The interface plays a crucial role by making invisible interactions legible and controllable for the user.

PROJECT CONTEXT

WaveSwitch explores the evolving relationship between humans, gestures, and technological mediation in domestic and professional environments. By combining a connected object, gesture recognition, and interface design, the project investigates how interaction design can move beyond traditional buttons and screens to create new forms of intuitive control within future living spaces.

ABOUT THE PROJECT

Software updates create a suspended moment in the user experience. During this time, the phone becomes temporarily unusable and the user waits for the system to complete its process. This project explores how that imposed pause could become a meaningful interaction instead of an empty moment.

CURRENT EXPERIENCE

The waiting time during an iOS update is usually perceived as passive and frustrating. Users are confronted with a progress bar and cannot interact with their device while the system installs the update.

CONCEPT PROPOSAL

iOS 26 Update introduces an optional introspective experience available only during the update process. With Apple Intelligence, users can answer a short prompt to generate a personal message that they can modify and rediscover during the next update. While the system progresses in the background, the interface transforms a technical wait into a quiet, reflective moment.

Google Play on iOS

ABOUT THE PROJECT

In 2024, the European Union introduced the Digital Markets Act (DMA), requiring Apple to allow alternative app stores on iOS within the EU. This regulatory shift opens the possibility for competing ecosystems to coexist on the iPhone. This project explores what Google Play could look like if it were designed specifically for iOS rather than simply adapted from Android.

DESIGN QUESTION

Integrating Google Play into the iOS ecosystem is not a simple porting exercise. Apple's interfaces are defined by strict conventions: clear hierarchies, restrained visual language, and subtle micro-interactions that create a strong sense of coherence across the system. If an application deviates too far from these conventions, it immediately feels foreign within the platform.

DESIGN SYSTEM PROPOSAL

The project develops a design system imagining Google Play as a native iOS experience while preserving the identity of Google's ecosystem. Layout structures, spacing rules, components, and typography were redesigned to align with Apple interface standards. At the same time, elements of the Play Store identity were preserved and adapted to create a credible hybrid experience between two major product cultures.

Concurrence ?

L'App Store est le magasin d'application des utilisateurs des terminaux Apple. L'App Store est réputé pour être assez pauvre face à son concurrent sur Android. L'intégration du Google Play sur iOS permet une ouverture concurrentielle et d'esprit !

Obligation de la part d'Apple ?

Avec le Digital Markets Act (DMA) entré en vigueur en 2024, l'Union européenne oblige Apple à autoriser des magasins d'applications concurrents sur iOS au sein de l'UE. L'objectif est de limiter sa position dominante en imposant l'ouverture aux stores tiers et aux paiements alternatifs, afin de renforcer la concurrence et le choix des utilisateurs.

Zone rouge

La zone rouge correspond aux contours de l'iPhone, il est interdit d'afficher quelconque élément dans cette zone, sauf la "Status bar - iPhone" et le "Home Indicator".

Éléments iOS

Les éléments iOS, soit la "Status bar - iPhone" et le "Home Indicator" doivent être présents et au premier plan dans chaque frame. Aucun éléments doit rentrer en conflit avec.

Colonnes

Les colonnes (par trois) doivent obligatoirement être présentes sur toutes les frames. Voir ci dessous les règles.

Espacement sur 4pt

Les espacements doivent obligatoirement être sur 4pt, sauf quand les éléments sont confrontés aux colonnes et à la zone rouge, on suivra toujours les colonnes et la zone rouge.

Google Play

Le Play Store devient le Google Play sur les appareils iOS. L'objectif est de transformer l'app iconique des terminaux Android pour qu'elle s'intègre aux normes Apple. App conçue pour les iPhone suite à l'ouverture des magasins d'applications alternatifs en Europe.

Du vert au bleu

Le vert  emblématique du Play Store évolue en Bleu  iconique pour s'intégrer aux normes de iOS. Évidemment, les petites touches de vert emblématique rappelleront la nostalgie d'une époque désormais passée.

Les 4 Couleurs

Lorsque les couleurs suffisent pour reconnaître une marque, une valeurs et une vision, il faut impérativement reprendre ce qui est fait de mieux pour mieux faire encore. Pas besoin de vous expliquer que ces trois couleurs représentent Google.

Dessiner le logo

Sans l'écriture, c'est rendu possible grâce à la Google Flex Sans Font permettant de faire ressortir ce que Google fait de mieux, la vie.

Le Défi

Créer une version de Google Play sur iOS depuis l'ouverture aux magasins alternatifs n'est pas un simple portage technique, c'est un exercice d'équilibre. Il faut comprendre les codes installés par Apple avec l'App Store : clarté des interfaces, hiérarchie maîtrisée, micro-interactions discrètes, sentiment de confiance. Sur iOS, tout est question de cohérence systémique. Si l'expérience dévie trop, elle paraît immédiatement étrangère. L'enjeu est donc de s'inscrire naturellement dans cet environnement sans donner l'impression d'un corps rapporté.

En parallèle, il est essentiel de préserver l'ADN du Play Store sur Android : ses recommandations dynamiques, son identité visuelle, sa logique orientée services et contenus. L'inspiration du Google Store apporte une dimension supplémentaire avec un design system plus mature et modulaire. Le défi consiste alors à faire dialoguer ces deux cultures produit sans dilution, en créant une expérience crédible, hybride, et contemporaine.

Name Quest

ABOUT THE PROJECT

NameQuest is a board game designed to explore how names can influence social perception and group dynamics. Rather than addressing discrimination through theory alone, the project turns these mechanisms into a collective experience shaped by discussion, interpretation, and strategic decisions.

GAME SYSTEM

The game is built around social deduction mechanics, where each player receives a role and must navigate incomplete information, alliances, and suspicion. Through these interactions, NameQuest highlights how identity markers can affect trust, judgment, and decision-making within a group.

DESIGN APPROACH

The project combines game mechanics, visual clarity, and narrative tension to create an experience that is both playful and reflective. Cards, board elements, and interaction rules were designed to support readability while encouraging players to question how biases can emerge in everyday social situations.
